PCI Express...Total Solution

Exerciser • Analyzer • DVT Platform • Extenders • Adapters

XERCISER

- Emulate Upstream or Downstream Devices .
- Pattern Generator for Device Characterization .
- Testing PCI Express Designs Without requiring a Motherboard .
 - Error Injection & Bit Level Manipulation .
 - Adjustable Bandwidth Traffic Generation
 - Extensive Control on all Layers .
 - External In/Out Cross Triggering ability .

BUS & PROTOCOL ANALYZER

- Extensive Trigger & Capture Control .
- Real Time & Post Capture Filtering .
 - Packet & List View Data Display .
 - High Capacity Trace Buffer .
 - Protocol Error Detection
- Statistical & Real-time Performance Analysis

PXP-100 DVT Platform

- Two x16 slot Development Platform with Reset & Clock
- · Supports x1 up to x16 designs
- Auxiliary Mid-bus pads; Self contained and self powered

Adapters & Extenders

 Various adapters and extenders to allow extending & mixing different lane configuration designs, adapt to x4 Infiniband, Loop-back, Bus Terminations supporting up to x16 designs.

Mid-bus Probing

 Interface Hardware for Analyzer to be used as a Mid-bus Probe

CompactPCI® Systems

The Magazine for Developers of Industrial, Communication, and Embedded PCI Systems

Volume 7 / Number 9 / December 2003

CompactPCI *Systems* is published by:

OpenSystems Publishina™

ON THE COVER:

Elma's 5U ATCA Development Chassis is ideal for prototyping and demonstrations. The portable unit plugs into a conventional wall outlet and includes provisions for hot swapping the Elma IPM Sentry Shelf Manager.

American Portwell's Dual Intel® Xeon™ processor PICMG 1.2 SBC, the ROBO-8820VG2 comes with VGA and dual GigE.

WE UNDERSTAND

We're engineers too. We all love a good challenge, that's what makes us engineers! But in today's tough business climate, some of those challenges can wear you down and burn you out. That's where we come in. We're Performance Technologies and we can help. Our embedded computing and system-level solutions will not only ease your integration and time-to-market stresses, they'll beef up performance while lowering project and operational costs. All the while restoring your sanity so you can tackle those more interesting challenges - like the one to the right.

With more than 45 years of I/O experience and an unmatched selection of Industry Packs and I/O boards, Acromag is the one to trust. Our boards deliver uncompromising performance supported by time-saving software tools and cost-cutting high channel density — to ensure your projects stay on schedule and within budget.

Industrial-strength designs with extended temperature ranges make Acromag I/O ideal for COTS and manufacturing applications. And with actively managed product life cycles, you're ensured of long-term availability.

Count on us for PMC, too.

Our newest boards deliver impressive performance and outstanding value to PMC, PCI, and CompactPCI formats. Whatever your I/O need, Acromag has an I/O answer depend on it.

An Avionic Communications Bus Monitoring & Analysis System

- Monitor & record multiple MIL-STD-1553
 and/or ARINC-429 buses simultaneously
 - Review during Real Time Monitoring
 - Show data in engineering units
 - Display data sequentially or selectively.
 - Display data in hex, decimal, binary...
 - Display data in different graphic styles
 - Designed for lab & field applications
 - · Respond to user-defined triggers
 - Work in Real Time or Replay mode
 - Visuals of derived engineering units
 - Export data to third party tools
 - Option to support other buses
 - Easy installation: no dongles

avionic databus systems - computers - software - cards couplers - cables - connectors - terminators - transformers

Choosing the right CompactPCI board for your MIL-STD-1553 applications

By Rich Wade

he telecom market was, and remains to a degree, the initial impetus for the success of CompactPCI. Despite the downturn in the telecom market it continues to be a mainstay in computer telephony, real-time machine control, data acquisition, industrial automation, and commercial and military avionics. CompactPCI is well suited for other applications that require high-speed computing, a robust package design, and long-term manufacturer support as well. It's no wonder that CompactPCI is rapidly becoming an alternative to VME as the preferred interface for many applications.

One of the reasons for this migration is primarily because VME equipment is often more expensive and more likely to become obsolete. In addition to being cost effective over the long haul, CompactPCI's rugged, modular design comes in 3U and 6U sizes, identical to the VME form factor and provides the advantage of the faster, plug-and-play PCI bus. Likewise, CompactPCI and PXI offer a viable alternative to VXI for test and instrumentation applications. This could be the reason that the avionics industry is integrating CompactPCI for both laboratory and flight applications.

Military applications rely heavily on the MIL-STD-1553 databus for communication between the pieces of equipment that make up an avionics system. Although the specific requirements needed for a MIL-STD-1553 interface vary by application, there are a number of key items to take into consideration when determining an optimal CompactPCI board for a military avionics databus application. These include:

- Channel density: Since aircraft avionics normally have multiple databuses, it's desirable to have multiple channels on a single board. This reduces board count, overall system cost, and power requirements.
- Memory: Avionics designers prefer interfaces that include more memory per channel providing greater flexibility for the application software, while increasing data buffering capabilities.
- Single and multiple function options: Single function (remote terminal ONLY, bus controller ONLY, or bus monitor ONLY) interfaces are satisfactory for simple applications, but the more complex the applica-

tion or system simulation, the more there is a need for a multiple-function interface. Ideally, multiple function interfaces should not only monitor simultaneously, they also need to be able to simulate all remote terminals and the bus controller. Additionally, the board's application programming interface (API) should allow operation with either single or multiple function interfaces from the same software. This allows development and testing using multiple function interfaces for system integration, while at the same time offering the advantage of using lower cost single function interfaces in the final system, eliminating the need to change the software.

Also, in determining the optimal MIL-STD-1553 CompactPCI board, engineers should consider the following Bus Controller, remote terminal, and Bus Monitor features.

Bus Controller features

Look for the following in Bus Controller applications:

- Frame timer: The interface should have an internal timer to manage message frame times relieving the controlling software from performing this task on timing.
- Conditional branching: Based on userdefined conditions, the Bus Controller should have the capability to branch to different message lists. This should be done on the board rather than requiring the controlling software to detect the condition and manually change the message list.
- Aperiodic messages: The Bus Controller should be able to inject aperiodic messages into the frame

while running, allowing easy insertion of one time events on the bus.

Remote terminal features

Look for the following in remote terminal applications:

- Message legalization: The remote terminal should support message legalization down to the word-count level. Many MIL-STD-1553 interfaces only support legalization to the sub-address level, while others do not support it at all. The benefit of message legalization is that it allows the device to block out unimplemented sub-addresses and word counts.
- Multiple data buffers per sub-address:
 The remote terminal should define as many message buffers per sub-address as desired (limited by available memory). The interface should also provide the ability to set interrupts on specific message buffers that will significantly reduce the demands on the controlling software for servicing the message buffers.

Bus Monitor features

Look for the following in Bus Monitor applications:

- Sequential monitor: The Bus Monitor should provide the option to record messages sequentially as they are seen on the bus, including error information. This should include options for filtering in order to capture only the desired messages. The sequential monitor should also have the ability to define trigger events to start and stop monitoring.
- RT Monitor: The Bus Monitor should provide an option to record messages by remote terminal and sub-address.

This is useful for current value monitoring where one is interested in the most current data for a specific remote terminal and sub-address.

Message Time: All messages that the Bus Monitor captures should record the time that the message occurred. High resolution (1 microsecond LSB) is desired for accurate time correlation of data

Condor Engineering provides Compact-PCI interfaces for a variety of avionics databus protocols, including MIL-STD-1553, the new emerging MMSI protocol, ARINC-429, and other ARINC protocols (573, 575, 717, and more). The cPCI-1553 MIL-STD-1553 interface board from Condor Engineering is suited for military avionics applications. This product offers options for multiple channels, 1 Mbyte of memory per channel, single and multiple function configurations with common software, and includes the BC, RT, and BM features discussed previously.

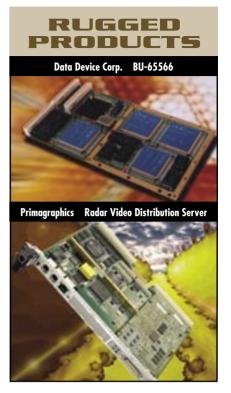

Rich Wade joined Condor Engineering in 2001 and is one of the developers of the CORE-1553 and CORE-MMSI products. He works

closely with Condor Engineering customers for system integration and application development. Rich has avionics engineering and management experience since 1995. He has a BSEE from New Mexico State University and is a Captain in the US Army.

Switched Fabric Enclosures— Our Collection Is Growing!

When it comes to switched fabric - whether compact packet switching
(PICMG 2.16) or StarFabric (PICMG 2.17), or even AdvancedTCA
(PICMG 3.0) - chances are Elma has the enclosure platform you need.

First to respond to the latest switched fabric technologies, Elma continues to expand its inventory of solutions. Check out Elma's collection and give us a chance to show you how accommodating our enclosures can be.

Switched Fabrics

- ■cPS8: PICMG 2.16
- StorFabric: PICMG 2.17
- ATCA: PICMG 3:0

Standard Enclosures

- 19" & 23" mck mount
- = 1U to 12U
- 2 to 21 slots
- IEEE1101.10/.11
- STMP

Cooling

- Up to 200 watts/slot
- =350LFM, cord cage
- Hotswap, N+1
- Removable filter

Power

- = 150 to 3K watts
- = 90 to 250VAC input
- 48VDC input
- Hotswap, N+1

Certification

- FCC Class A. B.
- UL, CSA, CE
- NEBS Level III

Shelf Management

- Manages all IPMI-compliant FRUs
- Fully PICMG 3.0 system management spec-compliant
- PICMG 2.9-compliant

Different TOEs for different folks

By Al Basseri

s Moore's Law has proven, processor performance doubles every 18 months. This has inevitably caused an application performance challenge. It has taken a compute bound problem and changed it to an I/O bound problem. I/O storage and server manufacturers have recognized this and have been addressing this issue as the I/O bottleneck grows worse each day. Compare this problem to that of city and state transportation planners who have realized the rapid growth and subsequent daily traffic bottlenecks in major metropolitan areas such as Silicon Valley. These bottlenecks have hurt the long-term growth and stability of the area. As a result, businesses have partially or completely moved away from the Silicon Valley because of the high cost of operations and overall diminished ROI.

Just as transportation planners struggle to come up with alternative solutions to address the bottleneck, many hardware manufacturers have faced similar challenges. Unfortunately, most have not learned from the mistakes that city planners have made in the past. Simply building more housing or roads has not addressed the problem. Building new roads and then restricting the types of traffic that can move through these roads only creates new standards and adds another level of complexity. Yet, the fundamental problem still exists. Similarly in computer architecture, the problem is not simply storage, but it also involves server-to-server traffic.

The majority of I/O bound problems today are Ethernet based TCP/IP traffic. It is the processing for the transport layer and the link layer that are increasing the load on the host CPU and indirectly affecting the

application performance. Mission-critical network applications require support for a high number of concurrent sessions while maintaining acceptable throughput.

Common TOE designs

TCP/IP Offload Engine (TOE) solutions offload TCP/IP processing from the host CPU, increase network throughput, and in essence, create more CPU cycles for application processing. Refer to Figure 1 for an overview of the key benefits derived from utilizing TOE. Many TOE developers have addressed the bottleneck issue strictly from a storage point of view by focusing on applications with few concurrent sessions and large data transfers. Just as most roads are packed with lots of cars and not larger vehicles, the typical mission-critical network application is being occupied by an increasing number of concurrent TCP sessions carrying small TCP packets over IP. Most available TOE designs cannot address the issue in the high-session count environment. Yet a majority of the I/O bottleneck occurs in such an environment.

Another drawback of many TOE designs in today's market involves the need for large buffer memory for TCP segment reassembly to address dropped, or out of order segments. Since the required buffer size is dependent on the TCP connection bandwidth and the end-to-end delay, the buffer grows with the network's speed resulting in higher costs. In addition, as the number of connections increases the performance drops. As it turns out, the bandwidth required to support that level of memory is at least twice the wire speed, requiring a complicated highspeed memory design. In this case, the TOE needs hardware in order to inter-

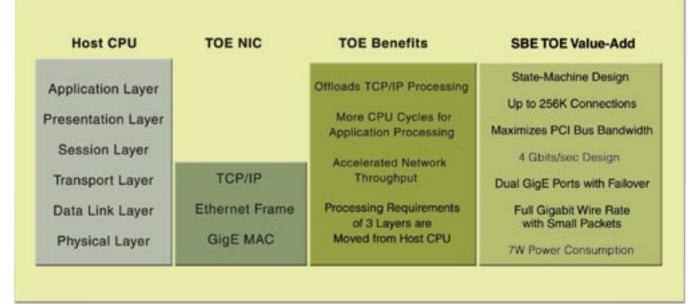

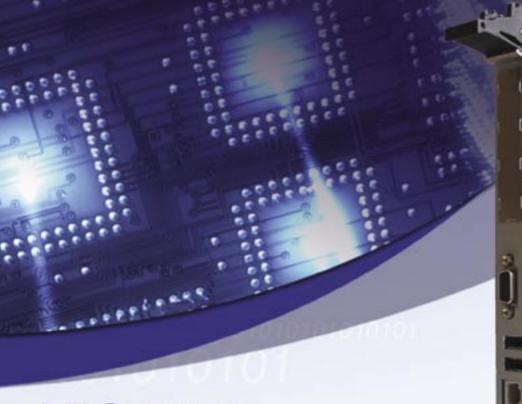

Figure 1

6U CompactPCI Low Power Intel[®] Pentium[®]-M Processor Board VGA / Dual Giga LANs / PMC

MIC-3368

- Intel Pentium-M Low Power 1.6GHz
- Dual Gigabit Ethernet on board
- Intel E7501 Chipset support 400MHz FSB
- PICMG 2.16, 2.9 and 2.1 compliant
- Up to 2 GB (DDR-200) memory on board with ECC
- 64-bit/66 MHz PMC expansion slot
- Optional on-board 2.5" HDD or Compact Flash
- Master/Peripheral (drone) mode selectable

Network Computing

www.advantech.com/nc 760-929-9122 cpci.info@advantech.com face to larger and wider memory, further elevating development time and costs.

Optimizing TOE for high session count applications

The optimal solution to the high session count problem is to design a fast-through TOE. A fast-through TOE allows all of the data, whether in-order or out-of-order, to be processed immediately from the TOE to host memory. This eliminates the additional cost and complexity associated with introducing a TCP reassembly buffer. To achieve this immediate result, SBE is developing a TOE solution that processes information from each TCP segment it receives immediately, without requiring a larger buffer. Figure 2 illustrates the general architecture of the SBE TOE solution. SBE's TOE board is based on a state machine design that supports up to 250,000 concurrent sessions while maximizing the bandwidth of the existing bus. More importantly, all of this occurs while consuming as little as 7W of power. It is a simple and effective solution for addressing high traffic loads on individual servers. Now as far as Silicon Valley traf-

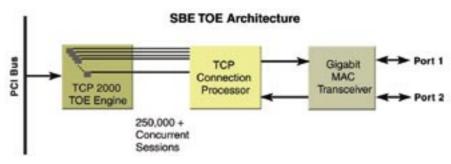

Figure 2

fic goes that problem will be for the new California Governor.

Al Basseri has more than 10 years of management experience in marketing and support involving enterprise software, security, and storage area net-

works. At SBE, Al manages the strategic business development and product strategy for enterprise solutions, including TCP/IP Offload Engine. Prior to joining SBE, Al held key positions at industry leading companies, including BEA Systems. He holds a Computer Science degree from San Jose State University and has written numerous papers on enterprise support methodologies.

Suddenly, GE is the most recognized name in embedded systems.

GE has brought together two names that you've known for years to provide an impressive range of open-architecture embedded solutions — now backed by the reliability and global support of one of the most respected companies in the world. Take advantage of our proven RAMiX and VMIC expertise in embedded systems combined with the full breadth of GE's knowledge and resources.

Whether it's VME, CompactPCI®, PMC, PCI or PC/104-P/us, GE offers leading-edge solutions tailored to your application. From single-board computers (Intel®, MIPS® and PowerPC) to complete I/O systems to industry-leading communications technology (Ethernet, PICMG® 2.16 switches, Fibre Channel, SCSI and Reflective Memory), you can rely on GE for a complete end-to-end solution.

Call us today to tap into embedded solutions and the reliability of GE at 800-322-3616 / 256-880-0444

Embedded Systems

Real-time control system for lithography stepper machines

By Abdelilah Aadil

ince the IC first became commercially available in 1961, it has undergone remarkable change. The IC has become incredibly small and can now incorporate millions of transistors, offering unbelievable performance in myriad applications. The original IC, by comparison, only housed one transistor, three resistors, and one capacitor.

Today, ICs are used in all kinds of electronic products and systems, from personal computers and mobile phones to televisions, air conditioners, and other appliances. They can also be found in video game systems, automobiles, corporate and government information systems, factory automation, and other industrial applications. Virtually every element of the infrastructure that supports our daily lives contains ICs.

There is a direct link between the evolution of the integrated circuit and that of electronic products and systems. The microprocessors that are used in the personal computers of today, for example, integrate more than 50 million transistors and feature operating frequencies some 20,000 times faster than the ICs of the early 1960s. Personal computers built around these new, more powerful ICs can send and receive music or video data, download software, and they allow users to enjoy online games and take advantage of other useful, innovative Internet-based applications, delivering the blazing speed users today demand. The super-powerful ICs of today have also made possible exciting new portable products such as digital still and video cameras, PDAs (Personal Digital Assistants), and digital audio devices, as well as home entertainment appliances like digital TVs and DVD recorders.

The significant increase in the performance of ICs (number of transistors per chip and density) and processors, in terms of MIPS that practically double every 1.5 to 2 years, as well as the marked decrease in the cost of production, is due primarily to the huge strides made in manufacturing technology. These strides have also been the catalyst in the propagation of electronic products and systems. Semiconductor manufacturers have faced and are still facing big challenges in finding lithography stepper solutions that can meet their technology, production, and cost needs. This poses a considerable chal-

lenge to lithography tool manufacturers by keeping up the product improvement process while driving down the cost of ownership. The two most important features for improvement in a lithography stepper machine are:

- High resolution and wide exposure fields (wafer support, projection lens)
- Throughput and machine stability (number of wafers per hour, vibration, and temperature)

The throughput, the productivity of a lithography stepper machine, is heavily dependent on the performance of the computer control system. This machine component is responsible for controlling and monitoring all other components making user's experiments precise and speedy.

The computer control system consists of two layers of hierarchy, the user interface computer (UIC) and the machine interface unit (MIU). The UIC layer is mostly based on a PC serving as a terminal that provides various kinds of graphical interface windows for the user to control and analyze the measured data with. The UIC is linked to the MIU via a serial connection (remote control).

The MIU is basically a standards-based embedded single board computer system such as VME and CompactPCI. The data acquisition and processing in real-time make the PowerPC architecture the most adopted platform technology in these computer controlled lithography applications. The control of the stepper motors and their scalar motion is done using a PMC I/O card (see Figure 1).

The computing performance of the control unit is highly important for a faster and more accurate positioning of the wafer stage. A fast execution of the acquired data and shorter reaction time (feedback control) enables a fast machine throughput.

Current state-of-the-art semiconductor projection lithography employs line widths and positioning accuracy in the 100nm range. The basic concept of the control system consists of two sets of position sensors that monitor the position of an XY grid encoder, an integral part of the XY stage that supports the wafer, and monitor the X and Y coordinates. Both types of position sensors have sub-nanometer resolution and a repeatability of a few nanometers. The XY encoder sensors can monitor the position over the full size of the wafer.

The position sensors feeds the sensing signal back to the PMC I/O card, where the position of the mechanical stages in real time is done by the MIU using linear step motors. The high resolution results in large data inputs that require large bandwidth on the hardware side. Having two decoupled PMC channels on the single board computer (PowerPC CPCI-695 or CPU-695-VME from Force Computers) carrying the PMC I/O cards is a huge advantage. Also, the implementation of the PCI-X technology enables more than 16 Gbits/sec aggregate throughputs at a maximum frequency of 133MHz.

Achieving sub-nanometer positioning requires a device to shift from today's paradigm of optical lithography techniques, causing a data-handling problem. Tailoring the system to take advantage of the chip repetitions over the wafer as much as possible requires an effective way of making the data, or pattern-data available, and reduces the frequency of storing data to a disk when the data volume exceeds the memory size. Having a control system featuring a large, fast memory like DDR SDRAM with up to 4 Gbytes memory and a maximum bandwidth of 25.6 Gbytes/sec (Force Computers CPCI-695, CPU-695-VME) is a real relief for system architects of lithography stepper machines.

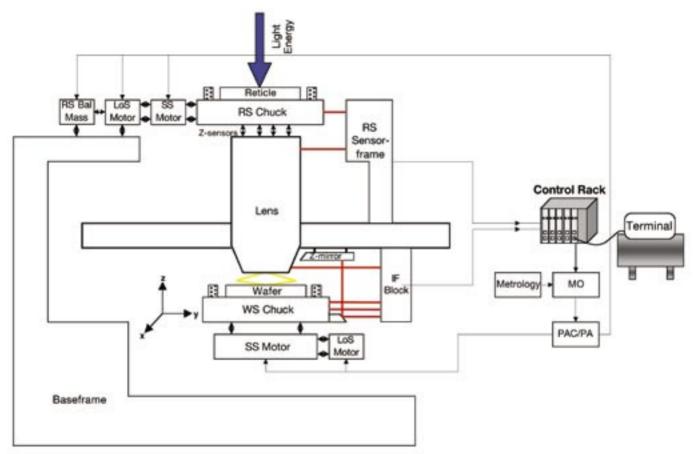

Figure 1

The control unit interface system consists of different I/O boards performing different tasks within a lithography machine (see Figure 2). Each SBC is responsible for certain functions or group of functions. These functions can include diagnostics, gathering system-related information such as application's task status or statistics, and calculating the XYZ positioning. Position stages where the control system reads the voltage from all relevant potentiometers, converts them into positions, and displays these values in terms of millimeters to the user display screen is one example of these responsibilities. The SBC can also compare the magnet position with the user set point values. Then if the magnet position is not within the five micron tolerance limit, the program calculates the new displacement before converting it to micro-stepping motor pulses, with optimum speed and acceleration curve set points, and sends the new value to the motor controller.

The communication media between the different nodes of the control unit is CompactPCI, VME, or Ethernet. This common interface is basically used to exchange data.

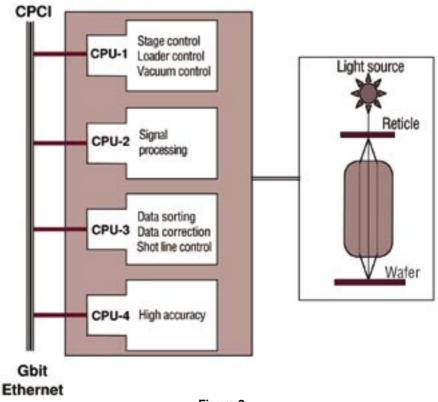

Figure 2

Top Performance for your Testing Needs

The Fastest and the Deepest Manufacturing Test Digitizers and General Purpose Scope Cards

CompuScope 82GC

- 2 GS/s A/D Sampling
- → 1 GS/s A/D Sampling on two Simultaneous Channels
- → CompactPCI/PXI or PCI Bus Format
- . Up to 16M On-board Acquisition Memory
- → Compatible with GageScope® Software

CompuScope 1610C

- 16 Bit, 10 MS/s A/D Sampling on two Simultaneous Channels
- Up to 8M On-board Acquisition Memory
- → 70 dB Signal to Noise Ratio
- Multi-Channel Systems of up to 16 Channels at 10 MS/s

Expand the capabilities of your PC-based or PXI test system with high performance digitizers in a CompactPCI Instrument Mainframe from Gage

Instrument Mainframe 8000C

- Ideal for housing CompuScope cPCI/PXI digitizers
- 7 slot capability
- High quality 550 watt power supply
- 217 CFM forced air cooling
- Qualified CompactPCI backplane
- → Seamless extension of your PC's PCI bus, or of your 3U cPCI/PXI system to include cPCI/PXI 6U capabilities

A Brand New Creation!

Xillimx FPGA

Adding Flexibility to power

- SMT365E DSP & FPGA Module
 64 bits 600MHz TMS320C6416 DSP
 Xilinx Virtex II FPGA XC2V6000
 256MB of SDRAM @100MHz and 8MB of FLASH
 Six 400Mbytes/s Sundance High-speed Bus
 Six ComPorts for InterDSP communications

- SMT374 DSP & FPGA Module Two 225MHz TMS320C6713 Floating Point DSP
- Xilinx Virtex II FPGA XC2V2000-4
 256MB of SDRAM @100MHz and 8MB of FLASH
- Six ComPorts and two 400MB/s SHB ports

SMT398 FPGA Module

- Virtex II range of FPGA devices
 Up to 8 million gates as a re-configurable resource
 4MB of high speed ZBT SRAM,
 2MB of high speed QDR-SRAM,
 External Clock & LVDS Interface
 Multiple FPGA/DSP support

SMT406 FPGA PMC Module

- SMT406 FPGA PMC Module

 Virtex-II FPGA from V4000 to V8000

 128MB of 133Mhz SDRAM, accessible from FPGA and PCI bus

 16MB, 200MHz DDR SRAM or QDR SRAM

 32MB, 250MHz DDR SDRAM and 16MB of Flash

 64 bits, 66MHz PCI interface

 4 programmable clocks generating up to 500MHz

SUNDANCE DIGITAL SIGNAL PROCESSING INC., Tel: (775) 827-3103 USA SUNDANCE MULTIPROCESSOR TECHNOLOGY LTD. Tel: +44 (0) 1494-793167 UK SUNDANCE ITALIA S.R.L. Tel: +39 0185 385193 ITALY

A high-bandwidth, fast data transfer media gives the control unit more power and shorter execution time. With the use of a high-bandwidth 64-bit universal CompactPCI bridge, the control system can benefit from the flexibility of using the same SBC either in the system or peripheral slot.

The 64-bit addressing, full speed conversion from 64-bit/33 MHz to 32-bit/66 MHz, and the configurable pre-fetch strategy for improved read performance allows a bandwidth of up to 4 Gbits/sec. This would significantly and positively affect the data traffic between the nodes and in turn improve the performance of the stepper machine control-unit.

The increasing trend of adopting a packet-based technology such as GigE for the data interchange, due to its simplicity and easy migration path, is quite clear. The new generation of PowerPC single board computers (e.g. CPCI-695 and CPU-695-VME) targeting such applications will have to be designed to meet the surge of demand by the system architects for more bandwidth and higher transfer rates.

Conclusion

Since semiconductors continue to ramp up in speed and density, lithography system manufacturers are forced to find out the answer to machine stability, throughput, and high-resolution challenges. Hence, understanding the end-application's needs and bottlenecks helps SBC manufacturers better align their designs and services, therefore responding to the

RSC# 3701 @www.compactpci-systems.com/rsc

continuous capability enhancements of the real-time control unit.

Abdelilah Aadil has been with Force Computers since 1998, working in several capacities as a technical account consultant, technical consulting

manager, and most recently as a product

marketing manager. Prior to joining Force, he spent two years in technical research for Siemens AG.

Not Your Average Machine Shop.

From CompactPCI shielding to PMC bezels to VME front panels, we speak your language. Simon Industries specializes in the design and manufacture of precision-machined metalwork for the embedded electronics industry. From quick prototypes to volume production, we deliver high quality panels, bezels, brackets, heat sinks, and heat frames, all at competitive prices. Call us for a quote on your next "not-so-average" job.

PRECISION MACHINING AND DESIGN

Ton GPIB-Based 610-Digit DMMs and One GPIB-Based Digitizer

Now there's a DMM that performs the job of 10 traditional 61/2-Digit DMMs.

National Instruments new NI PXI-4070 FlexDMM shatters conventional 612-digit DMM measurement speeds, while maintaining superior accuracy. You can use it to perform the same automated measurements in the same amount of time as 10 GPIB-based 61/2-digit DMMs. With its integrated 1.8 MS/s isolated digitizer capability, you can also use the FlexDMM to measure transient signals, perform FFTs, and many other custom measurements using National Instruments LabVIEW"or LabWindows"/CVI". No other DMM offers you more!

ACHIEVING NEW ELEVATIONS

In System Cooling

APW introduces a fault-resilient PICMG 2.16 system chassis. The new Ventus chassis delivers a scalable platform with redundant features for critical subsystem components.

Our thermal engineering team based the Ventus design around maximum cooling performance with a fan fault. The result is a revolutionary patent pending cooling scheme. Ventus fan trays combine a hybrid parallelserial fan approach utilizing multiple fans to direct airflow in a 90-degree bend without the need for additional steering devices such as baffles. Operating with conventional axial fan technology, airflow is distributed evenly across all 21 slots.

Hot swappable fan trays along with redundant hot swappable power supplies provide the basis for a fault-resilient platform for your "five 9's" system. Ventus is pending UL, CUL, TÜV and CE certifications and is designed to meet NEBS.

VENTUS - A fault-resilient chassis platform for PICMG 2.16 or scalable to your custom application. Call us today to see how we can accommodate your system architecture.

Call: 1(888) 884-4734 or get information now at WWW.APW.COM/VENTUS

AdvancedTCA and AdvancedMC provide robust, scalable telecom platform

By Jeff Durst

he year of 2003 was the year of PICMG 2.16. 2004 will usher in a new era, establishing AdvancedTCA (PICMG 3.0) and Advanced Mezzanine Card (AdvancedMC, or PICMG AdvancedMC) as the dominant platform for high-availability telecom applications.

Unlike many of their predecessors, AdvancedTCA and AdvancedMC are not buses in search of an application. They are not a modification and retrofit of general-purpose platforms in hopes of appealing to telecom OEMs either. AdvancedTCA and AdvancedMC are a system platform and expansion architecture designed by telecom for telecom. They spring from a collaboration of major telecom OEMs and suppliers aimed at developing an optimal telecom platform that addresses major bandwidth, availability, field upgradeability, cost, scalability, management, and interoperability issues.

AdvancedTCA has made substantial progress in the last year. In late 2002, PICMG gave approval to the base spec (PICMG 3.0), and the first alpha products were seen. In 2003, the first beta products and approval for a variety of protocols that will operate over AdvancedTCA's high-speed fabric, including Ethernet/ Fibre Channel (PICMG 3.1), InfiniBand (PICMG 3.2), StarFabric (PICMG 3.3), and PCI Express (PICMG 3.4) have come to fruition. In the coming months, PICMG will finalize the RapidIO (PICMG 3.5) sub spec, and they will also resolve the sticky connector IP issue. Creating an IPfree connector specification to facilitate reasonable and nondiscriminatory licensing rights will pave the way for widespread product availability in 2004.

AdvancedTCA isn't the first open-architecture platform to target the telecom industry, but it is the first platform designed from the ground up for telecom. CompactPCI Packet Switching Backplane (cPSB or PICMG 2.16), for example, is an adaptation of the general-purpose CompactPCI bus that adds telecomfriendly features such as Ethernet back-

plane transfers (PICMG 2.16) and system management (PICMG 2.9). By contrast, AdvancedTCA integrated system management and support for multiple protocols are parts of the baseline spec. In addition, AdvancedTCA provides much higher throughput (10 Gbit/sec vs. 1 Gbit/sec per link), supports a full mesh interconnect (in addition to 2.16's Dual Star), accommodates higher power (up to 200W versus 50W), and provides a larger form factor (8U versus 6U), all of which are invaluable for telecom applications.

The AdvancedMC expansion interface, slated for PICMG adoption in Q2 of 2004, makes AdvancedTCA even more attractive by enhancing its scalability, flexibility, and field upgradeability. By combining a general-purpose AdvancedTCA carrier card with application-specific AdvancedMC modules, designers can create versatile telecom blades whose functionality and/or capacity can be upgraded without replacing the entire blade.

With AdvancedMC, designers are free to create scalable, high-density modules dedicated to a specific function, such as control, SIGTRAN signaling, transcoding, interfacing, or packet processing. They can also combine multiple functions on a single blade and alter the mix as applications and/or system partitioning changes. Artesyn expects that blades combining an AdvancedTCA carrier with AdvancedMC modules will be the best fit (vis-à-vis fixed-function AdvancedTCA cards) for up to 80% of telecom applications. These modular blades will cost a bit more, but the ability to upgrade and scale them will far outweigh this incremental initial cost premium.

AdvancedMC is optimized for high-performance packet-based telecom environments,

but TDM emulators are available for interacting with the PSTN. AdvancedMC modules communicate with the AdvancedTCA baseboard via a packet-based serial interface. Ethernet is the defacto protocol, but the AdvancedMC interface can support any number of protocols, including PCI Express, RapidIO, and InfiniBand. AdvancedMC modules are hot swappable FRUs (field replaceable units), enabling them to be replaced individually in the field. They also provide an IPMI-based interface, enabling them to be remotely monitored and maintained via Remote Access System Management (RASM).

The idea of an expansion module isn't new. PMC, for example, is the expansion module of choice for VMEbus, CompactPCI, cPSB (PIGMG 2.16) and many custom designs. PMC even has an offshoot for telecom applications called PTMC (PCI Telephony Mezzanine Card) that brings a TDM bus up to the module along with other optional interfaces such as RMII or Utopia. However, even with these enhancements for telecom, PMC isn't ideal for telecom. For one thing, PMC uses PCI as the control plane bus, and consumes extra management resources. Equally important, PMC modules aren't hot swappable, and the spec only allows 7.5W per module.

AdvancedMC modules can be used to provide a broad range of processor (such as CPUs, network processors, and DSPs), coprocessor (such as encryption/decryption engines), LAN/WAN (such as Ethernet, OC-x/STM-x, T1/E1, and Fibre Channel), and mass storage options. This flexibility makes the modules very easy to integrate at the system level.

Figure 1 shows how an AdvancedTCA card equipped with AdvancedMC mod-

SPECIAL FEATURE

ules might be used to implement a scalable signaling blade. The server modules runs the upper level signaling stacks such as SS7 MTP3, SCCP, ISUP, TCAP, and/or MAP. The signaling modules run the lower level signaling protocol such as SS7 MTP1 and MTP2. Mass storage devices log blade and signaling link activity.

Component suppliers have been trying for almost two decades to create an open architecture platform for telecom systems that would entice telecom OEMs to use off-the-shelf solutions. At long last, close collaboration between component suppliers and telecom OEMs has produced such a platform. With an eye toward high performance, availability, integrated system management, and field upgradeability, AdvancedTCA carriers equipped with application-

General Standards Corporation

High Performance Bus Interface Solutions

New High-Performance Serial I/O

The CPCI-SIO4 is a four channel full-duplex RS-422/485 serial board. Each channel can operate up to 10 Mbits/s. Optional 32 Kbyte FIFO buffer for both transmit and receive (256 Kbytes Total FIFOs) data on each channel provides for a smooth and efficient interface between the serial interfaces and the host computer. The board is based on the Zilog Z16C30 high speed Integrated Universal Serial Controller (USC) which supports Asynchronous, Isochronous, Bisync, Monosync, HDLC, SDLC, External Sync and Nine-Bit protocols. Call General Standards for driver availability and more information.

RSC# 44 @www.compactpci-systems.com/rsc

specific AdvancedMC modules provide the consummate foundation for building telecom blades. These blades provide the scalability and flexibility needed to power next-generation packet networks. Ultimately, AdvancedTCA and AdvancedMC will lower the life-time cost of ownership by leveraging efficiencies and reducing time to market, allowing TEMs to outsource enabling technology, lowering maintenance costs, and providing a roadmap to future technologies.

Jeff Durst has been with Artesyn Communication Products for 17 years. Since joining the company in 1986 he has served the company in

systems engineering, hardware engineering, and engineering project management. Jeff moved to marketing in 1999, focusing his efforts on new product definition by establishing the market, direction, and subsequent technology roadmap for the Artesyn product lines. Jeff acts as the main liaison between Artesyn's engineering and marketing organizations, serves as Artesyn's representative on PICMG's executive subcommittee, and participates in PICMG specification subcommittees.

ANY thing you want!

Fill all your enclosure and panel needs from XTech!

Compact PCI Front Panels — Customized and Standard

- · Custom design, finish and assembly
- Fully customized variations to standard specifications
- Ejectors: any type cPCI, standard or customized
- Gaskets: finger stock or foam
- Components: board holders, screws, and more

Extruded Aluminum Enclosure Systems — Customized and Standard

- 14 standard profiles to choose from
- Affordable customized enclosures and end panels
- Multiple finish options: powdercoat, anodized or silk screening
- Machining and assembly available

Custom Extruded Front Panels for all Electronics Applications

- Custom assemblies: fiber optic connectors, EMI shielding, board mounts, baffles and board stiffeners
- Multiple finish options: polycarbonate overlays, electroless nickel, and anodizing
- Custom ejector systems to fit your chassis needs

Contact XTech ANYtime!

Your only source

Electronic enclosure packaging trends in 2004

By Justin Moll

or the electronic enclosure packaging industry, 2004 is going to be an exciting year. There are many technological advancements and important products that will hit the market. AdvancedTCA, Serial RapidIO, VXS, and PCI Express will all have an impact on our market in the coming year. Some will see a full ecosystem available; others will just be starting to get off the ground. Technological trends in basic silicon such as integrated signal conditioning, the rollout of new commercial platforms such as PCI Express, enhancements to GigE, and wireless networks are just a few of the forces that will continue to reshape our market.

This year saw many important steps forward in the above technologies, as well as many others. In 2003, AdvancedTCA took several leaps forward. Dual Star and Mesh AdvancedTCA backplanes are now available in various sizes such as 2-, 5-, 6-, and 14-slots. AdvancedTCA chassis have been developed in 3U, 4U, 5U, 12U, and 13U heights, with various configurations. Now one can even use an AdvancedTCA Development Chassis for prototyping or testing, with A/C converters for plugging to a conventional wall outlet. Shelf managers are also available that have been specifically designed for the PICMG 3.0 specification, utilizing redundant radial or bussed IPMB's and dual 48VDC power feeds.

In PICMG 2.16 packaging also advanced in 2003, mainly on the backplane side. There are a wide range of configurations now available. For example, one can find low profile 4-slot and 8-slot PICMG 2.16 backplanes for 2U and 4U horizontal chassis respectively. Also, the shelf managers mentioned above have been integrated into PICMG 2.0/2.16/2.17 solutions. There are even backplanes designed to easily plug or cable to shelf managers in these systems. 2003 saw similar expansion of configurations for StarFabric PICMG 2.17.

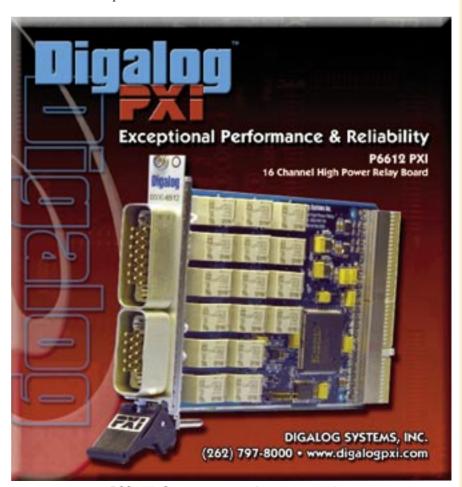

What should the industry see in 2004? Expect to see some critical leaps forward. For example, several companies have recently announced switch and node cards for AdvancedTCA, enabling the AdvancedTCA ecosystem to overcome an important hurdle. Packaging companies will have more opportunities to develop new units in various configurations, offering more choices for the market. PCI Express over AdvancedTCA will help bring further interest and momentum to the technology. PLX Technology Inc. is already performing live demonstrations of PCI

Express over AdvancedTCA in an Elma Electronic Inc. chassis. In 2004, StarFabric cards over AdvancedTCA with PICMG 3.3 implementations might also be seen.

There have been a few delays for VXS (VME Switched Serial) in 2003. However, the connector issues seem to be resolved and backplane/chassis configurations will hit the market soon. Many hope to see Serial RapidIO silicon in early 2004 to utilize over VXS. Expect to see VXS con-

figurations in 12-, 20-, and 21-slot backplanes initially and perhaps some smaller implementations as well.

Another trend in the market is the growing acceptance of CompactPCI in COTS chassis for military and security. Particularly in network security applications, CompactPCI backplanes are increasingly incorporated in 1U and 2U horizontal chassis, and various other configurations. Communications-based and network secu-

RSC# 47 @www.compactpci-systems.com/rsc

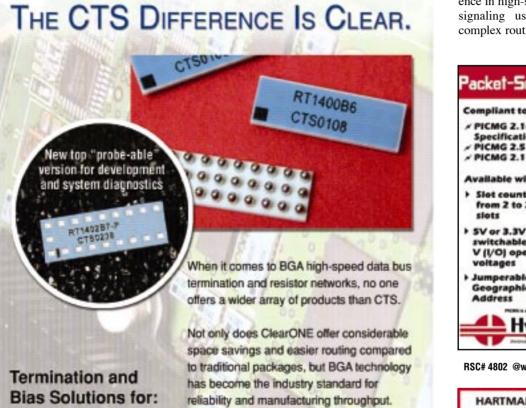

rity-based COTS chassis should continue this trend, providing a rugged solution with the required I/O, hot-swap capability, and performance.

On the technology front, higher processing power is leading to more stringent EMC requirements and superior thermal management. Packaging specialists are being asked to maintain EMC effectiveness over a wider frequency spectrum, with the

requirements exceeding 10 GHz at times. It is important to tackle EMC objectives early in the design stage. For thermal management, 6U form factor processor boards are migrating from approximately 40W per board to anywhere around 60 to 70W per board. This trend requires higher performance fans and monitoring/control. A few years back, alarm output fans like tachometer output fans and lock rotor output fans were the exception, whereas

today they are the rule (for most telecom enclosures). Redundancy in cooling is also increasingly sought after to enhance system reliability. In addition to all of the above approaches, to ensure optimal thermal management, it is advisable to simulate the cooling for new enclosure designs and subsequently perform testing to validate the outcome.

Backplane bandwidth and reliability requirements are also increasing. It will be important to choose a vendor with experience in high-speed design. As differential signaling usage increases, and more complex routing strategies are employed,

- LVD SCSI
- DDR & QDR SDRAM
- · CPCI and PCI-X
- · LVPECL
- VME
- · GTL, GTL+, AGTL
- FPGA
- · LVDS

Need a new solution? Using our thick film laser trimmed technology, CTS can quickly design and manufacture to meet your demanding application needs.

Kaparel/-RITTAL

Providing Complete High-Performance Electronic Packaging Solutions . . .

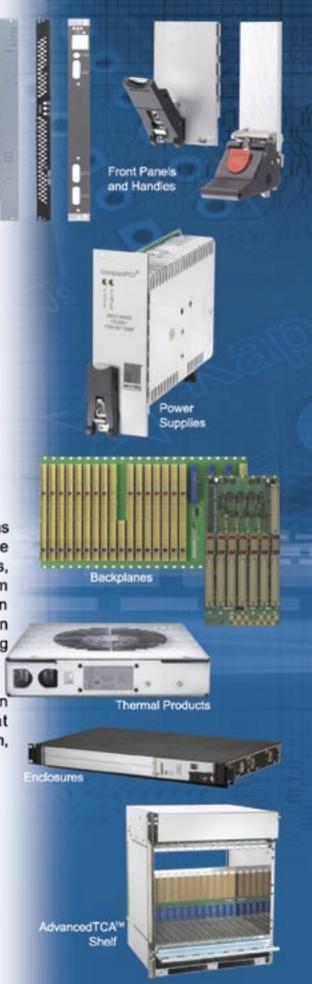

No one offers smarter embedded packaging solutions than Rittal and Kaparel. With literally thousands of the industry's best-designed products and components, we can provide complete off-the-shelf and custom products for high-speed computing applications in many platforms. And we do it quickly with dedication to perfection to help our customers bring winning solutions quickly to the market.

Call us today to get the perfect packaging solution for your next embedded application. Call us at 1-877-452-7273, or check the web at www.kaparel.com, or email info@kaparel.com.

Combined to bring great system designs from concept to reality. Now!

SPECIAL FEATURE

backplane companies will need to utilize powerful design capture and routing software. To provide the essential quality and tight tolerances in these designs, vendors should use up-to-date equipment and techniques. For example, a quality oven capable of providing uniform solder reflow for thick backplanes with high copper content should be used. Powerful simulation software and accurate testing equipment also figure significantly in quality high-speed backplane design.

In 2004 and beyond, it will be important to select a packaging company with experience developing modular, high-performance solutions. As EMC, thermal management, system management, and higher bandwidth are increasingly important in tomorrow's systems, it's vital to balance this criterion effectively to optimize the solution. Further, it will be critical to choose vendors that are stable and growing in capability by investing in efficient equipment, key technologies, and agile manufacturing software. Look for 2004 to be an exciting and eventful year for electronics packaging.

Introducing

to Make Your Next EMI/RFI GASKET a Success

Step #1 We've got the experience.

Standard or custom GASKETS- PCI, CompactPCI, and VME- Leader Tech, with almost two decades of EMI/RFI shielding innovation, can help you design the right solution for your next gasketing application. After all, we patented the CBS shielding design still popular today. Like everyone, we've got lots of product too, but we're more than just product. We're solutions oriented.

Step #2 We've got the desire.

We specialize in the needs of the small and middle-sized company. We know what difficulties you face. After all, we were once small too. Leader Tech has grown because it's dedicated to growing with its customers. We'd like to grow with you. We realize small today could mean industry leader tomorrow. Rely on us all the way to the top. And, when you make it, we'll continue to help keep you there.

Our AE's are not your typical order takers. They're highly trained technical sales reps. They'll take the time to understand your application and recommend new ideas. They're part of an experienced and dedicated hands-on engineering and customer service TEAM. At Leader Tech, we're all part of that same hands-on TEAM-including our President. He'll take your call; you're that important.

The Leading Edge in EMI Shielding Technology

Portable NTDS Analyzer

Take one for the road...

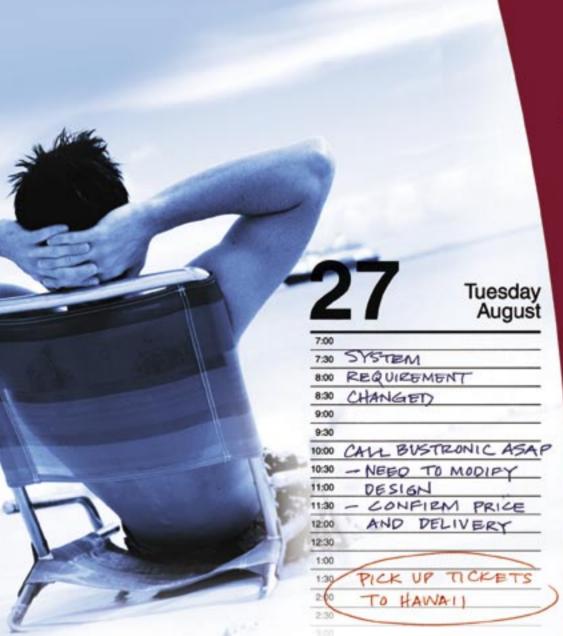

Performing complex data analysis of your NTDS I/O channels has never been so demanding. GET's portable analyzers can improve system performance and create a reliable and flexible solution to monitor, record, and debug NTDS channels with ease.

GET offers both luggable and laptop versions that are lightweight, ultra-rugged, and portable. Wherever your job may take you, shipboard or a Land-Based Test Facility, you now have the ability to analyze NTDS channels anywhere.

Features include:

- · Ability to analyze parallel and serial NTDS interfaces
- · Data pattern archiving for future reporting
- . Monitoring capabilities of two NTDS channels on laptop versions
- . Monitoring capabilities of eight NTDS channels on luggable versions
- · Laptop is battery powered for 4 hours, 6 hour option available

Peace of Mind

When Ron tried to clear up a few things before his trip, he found a system requirement change demanding a backplane design modification and maybe a shipment delay. But a quick call to Bustronic solved everything. Their Field Application Engineer for pre-sales support assured Ron the change would be made and the backplane ready on schedule. With global support from Elma and a skilled team of engineers and designers in the US and Europe, Bustronic's technical support keeps expanding while others scale back. With Bustronic on the job, you might just slip away for a little R&R and a lot of peace of mind.

Globally Leading the High-Performance Analog, Digital, and Serial I/O Industry

PMC Solutions

Reconfigurable Digital I/O

Asynchronous I/O

Whenever You Need PMCs ...

... Call Us.

Technobox designs and manufactures custom and off-the-shelf PMCs, including solutions for data acquisition, peripheral connectivity, serial communications, and engineering development.

Our extensive assortment of PMCs includes proven async communication adapters (from dual-port RS232 to 16-port combo boards); versatile, FPGA-based, reconfigurable, digital I/O boards; SCSI (from Fast/wide SE to Ultra 160) and IDE controllers; plus a variety of adapters, extenders, and tools for PMC development and/or integration.

We also offer the industry's only complete x86-based Processor PMC (PrPMC), as well as an ATX-based development platform for PrPMCs.

Processor PMC and PrPMC Platform

SCSI and IDE Controllers

PMC Adapters and Development Tools

A versatile approach to instrumentation

By Sacha Veillette

ignal processing, communication ports, bus interfaces, image processors, graphics controllers, analog I/O modules, digital I/O modules, signal conditioning, storage (flash memory or even removable hard disks for intelligence applications); this is just a short list of the realm of possibilities offered by the addition of mezzanine cards on a carrier.

As one contemplates the growing demand for flexibility, scalability, COTS content, and obsolescence-proofing of test systems and instrumentation, one can deduce that carriers and mezzanine cards such as PMCs are clearly at the forefront of technology development. It is an exciting subset of the industry where much has been achieved already, and much remains possible for the future.

Although not yet a provider of carrier or mezzanine cards, Gage Applied Technologies is quite impressed by what can be done through such an approach and is evaluating ways to use PMCs to increase the connectivity and throughput of existing and future data acquisition systems.

Carrier and mezzanine cards, what are they good for?

Carrier and mezzanine cards have many applications. The main advantage they bring to test systems is an ability to evolve with the changing application requirements. The carrier and mezzanine(s) card approach provides room for growth. Over time, it is possible to change the processing power, or the resolution and speed of analog capture channels, etc. A system conceived for one application may be adapted to the requirements of another simply by changing the mezzanine, thus preserving an investment made in learning how to program a processor mounted on the carrier.

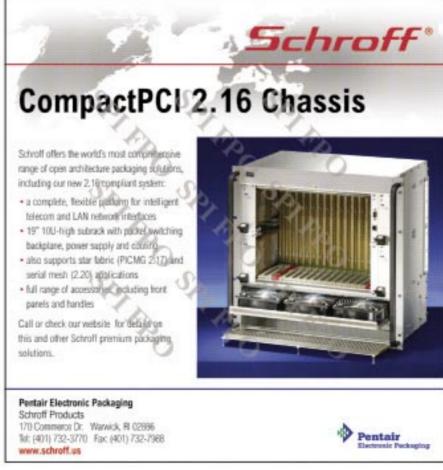

With developments in RF communications and radar applications often stemming from military requirements, the throughput of existing platforms like VXI and PCI (and related families like PXI) is often proving insufficient to the task of extracting intelligence from the signals. By placing processors (or dedicated DSP chips, versatile FPGAs, etc.) in close proximity to the data-capture and

signal-generation hardware, the captureanalysis-response loop closes tight. The controlling PC throughput requirement significantly decreases.

I like to think of carriers plus PMCs (or other mezzanine cards) as mini synthetic instruments. A typical example would be a software radio that relies on great processing power integrated with digitizers and synthesizers.

As a colleague from our sister company KineticSystems pointed out, it is also

interesting to see carriers designed to take a module from a different platform (say PXI 3U) and use it like a mezzanine card for integration into a VXI test system. This is an approach we are trying with an intelligent carrier from C&H Technologies and our own 6U CompactPCI products. This is done using the carrier and its microprocessor to extract valuable information from the rich data stream of our ultra-fast digitizers. I believe this is just one way to expand the already powerful concept of carrier and mezzanine card solutions.

RSC# 67 @www.compactpci-systems.com/rsc

Too many choices?

There appears to be a downside to such versatility however. While a system or a synthetic instrument can be easily upgraded through hardware substitution, there arises a further and often complex integration requirement. The programming effort can be substantial, and often requires expertise that resides exclusively with the original equipment supplier, thereby creating a locking-in mechanism.

Another challenge for test system users and integrators comes from the sometimes daunting task of deciding on the specific architecture to adopt. For instance, should one choose a DSP on the carrier and I/O on the mezzanine, or I/O on the carrier and PMCs to add DSP capabilities to the radar system? Versatility is a double-edged sword where the situation is complicated by the varying preferences of vendors, and the lack of a standard architecture for carrier-mezzanine solutions.

A bright future The combination

The combination of carriers and mezzanine cards is a proven approach that provides design versatility and plenty of growth potential. There is no doubt in my mind that combining carriers and mezzanine cards offers a powerful solution to many instrumentation requirements, integrating small size, high throughput, and expansion room for the changing requirements of mission-critical applications. It is an approach that, without blind acceptance, more manufacturers should add to their arsenal of solutions to instrumentation challenges.

Sacha Veillette is the marketing manager at Gage Applied Technologies, Inc. Joining Gage in 2001, Sacha brought with him

a diversified background including research in particle physics, project management in engineering, and leading a software development venture. He holds Master's degrees in both Physics and Engineering, the latter being a joint program MBA-EE, from the University of British Columbia in Vancouver, Canada.

Size Matters

The Radstone RT4 PowerPact CPCI System

Radstone's RT4 PowerPact CPCI system is the new benchmark for COTS compute nodes.

Cost-effective and capable of being installed in the smallest spaces, it will also survive the most rugged conditions. It's another breakthrough from Radstone Technology, the world's leading independent supplier of high-performance rugged COTS embedded computer products for defense and aerospace. This highly adaptable CPCI solution — just the size of a pack of CDs — stems from Radstone's long-standing expertise in delivering integrated subsystems and chassis as complete packages. It comes with a pluggable Power Supply Link, IMPLA processor card for access to RTOS environments and three conduction

Radstone Technology. Integrated Subsystems and Chassis

RSC# 78 @www.compactpci-systems.com/rsc

cooled 3U CPCI slots for application specific hardware.

Cuts Cost. Cuts Time to Market. Cuts Risk.

Applications

VoIP: Voice Gateways, Media Gateways, Wireless Access TDMoIP Gateways, Trunking Gateways, Packet Cable Gateways, IP-PBX, Broadband DLCs

PSTN: ISDN signaling, Signaling Converters, V5.2 and GR303 Access Equipment, Central Office Simulators, V52 LE Media Gateways, Access Gateways

Datacom: High capacity HDLC processing, Frame Relay based Base Stations, FRADs, PPP/ML test engines

Software Components

* GR303 or V5.2 CAS-MF, MF-R1/R2, ISDN-PRI based PSTN Module * V5.2/GR303/PRI supported IP Module * IP Signaling Module to interface with Intelligent Peripherals * Management Module with embedded SNMP agent * Multi-link PPP and FrameRelay embedded Data Communications Module

Feeling the pressure of costs of your next product offering to the market?

We have the answer - the EdgeBlade™ Family of highly integrated, full-feature blades for the CompactPCI and CompactTCA based architectures. Ready for you to quickly deploy and offer complete solutions for Packetizing the Edge of PSTN networks. The EdgeBlade™ Family helps you meet the challenges of migrating the legacy TDM voice networks to Packet architecture through its clever architecture and design. Our modular solutions enable you to easily traverse the TDM and Packet domain with support for V5.2, GR303, ISDN-PRI, VoIP, Frame Relay and MultiLink PPP/VPN.

The EdgeBladeTM Family offers higher capacity, higher performance, carrier reliability and compatibility with other devices on the Edge of the network.

Features

* PICMG for 2.15 & 2.16 * Dual cPSB for Carrier-Grade Redundancy * Additional 2 x 100 BT Ethernet ports for data * 16 x T1/E1/J1 ports * Onboard 480 channel DS0 switch & H.110 * Full support for all voice codecs and tones * Excellent Echo Cancellation support * SNMP, Telnet and CLI

CoNdor - Signal Monitoring

CoSystems develops and deploys Next Generation broadband central office switches for voice and data services. We specialize in conceptualizing and creation of complex systems and building blocks for telecom operators, ISPs, Cable MSOs, Cable Operators, and the emerging wireless voice and packet infrastructure markets. CoSystems product portfolio include Signal Conversion products, Access Gateways, Signaling Gateways, Media Gateways and DSL, Cable and WiFi technology based Broadband products.

CoSystems Inc., 1263 Oakmead Parkway, Sunnyvale, CA 94085, USA. Tel: +1 (408)-522-0500 Fax: +1 (408) 720-9114. Email: info@cosystems.com All brand names and registered trademarks are acknowledged to be the properties of the respective

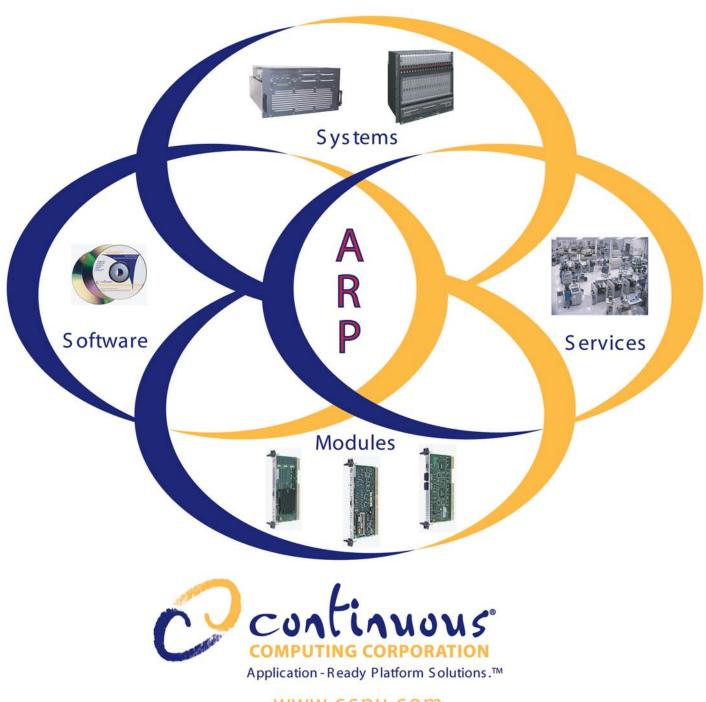

Are you a next-gen Carrier or TEM searching for VoIP, IN, 2.5G/3G and OAM&P Solutions?

Talk to Continuous Computing today!

We power your next-gen products with High Availability, Application-Ready Platform (ARP) building-block solutions.

The future of Boundary Scan

By Heiko Ehrenberg

oday's production environments and manufacturing schedules force test engineers to provide flexible low-cost test solutions in the shortest possible time. Time-to-market is of the essence more than ever, and every step involved in getting products out to the end user needs to be streamlined. These steps include design entry, prototype verification, production, final assembly, and also test and debugging at various stages throughout this process. For example, concurrent design and development of circuitry, product casing, as well as firmware and user software can shorten the product design cycle. Thinking in the early stages of product design about the test strategies to be applied in design, prototyping, manufacturing, and field-testing avoids costly delays as well as insufficient test access and test coverage throughout the product's life cycle. One of the most efficient test technologies for modern electronics is Boundary Scan¹ (IEEE Std. 1149.1, a.k.a. JTAG)², targeting many of the problems today's test engineers are facing.

Boundary Scan as board level technology is very well established. In recent years many chip designers started to utilize the Test Access Port (TAP) defined in the IEEE 1149.1 standard, to access self test circuitry built into the Integrated Circuit (IC). This allows designers and test engineers to run the IC's Built-In Self Tests³ at board and system level. Such tests verify the IC's functionality, often times at functional speed, and the connectivity at chip level. Furthermore, new BIST algorithms developed by various companies also allow the test of board and system level interconnections between ICs at functional speed. (Standard Boundary Scan utilizing the EXTEST instruction can be considered a quasi-static test.)

In addition to connectivity tests, Boundary Scan is also used to program devices such as serial EEPROM and FLASH EEPROM mounted on the PCB (on-board or In-Circuit Programming, ICP). Programming of PLD and FPGA components through their TAP (widely known as In-System Programming) is a well established practice as well and provides the benefit of last-minute changes on firmware, among many other advantages, especially important at the prototyping and design validation stage (as shown in Figure 1).

The ingenious way of accessing circuit nodes through Boundary-Scan cells built into ICs lends itself to system level testing as well. Shifting test patterns though a serial scan chain requiring four test bus signals accomplishes this task.⁴ Connections between motherboard and daughter cards, or between multiple boards plugged into a system backplane, can easily be tested as long as the sys-

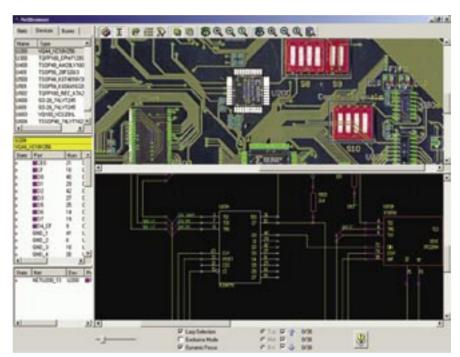

Figure 1

tem level test bus accessing the various Boundary-Scan chains is designed properly. In addition, such system level access extends the principle of onboard programming to in-system programming and reconfiguration.

Although Boundary Scan provides many benefits for testing modern printed circuit boards, as Figure 2 shows there is always a need for other test methodologies such as functional test, automated optical inspection, or in-circuit test (based on bed-of-nails adapter or flying probes). Using the same test hardware for both Boundary-Scan and complementary test methodologies, and even combining multiple test strategies in

one machine, can reduce costs of test setup, handling, and execution time. For example, by combining Boundary-Scan with Flying-Probe Testers, overall test coverage and test execution time can be improved.⁵ By combining Functional Testing and Boundary-Scan Testing, new types of tests can be created, simplifying development of Functional Tests and improving test coverage and diagnostics. Automated optical inspection can be used to extend Boundary-Scan test applications to the automated verification of visual features, such as jumper and switch settings, LED and LCD functionality, and so on. These types of tests can be referred to as extended Boundary-Scan applications.

Ideally, the setup of manufacturing test stations using not only Boundary-Scan technology, but also Functional Test and other tools, is low-cost, and provides a high degree of flexibility and modularity.6 Rack based test stations are common on production floors. Various hardware platforms are in use, such as GPIB, VXI, and more recently PXI.7 The adoption rate of PXI-based test systems is fast growing even though this hardware platform is only six years old. There is a wide variety of PXI modules available for this young platform. Furthermore, since PXI is based on the CompactPCI specification,8 CompactPCI modules can also be used in PXI systems and vice versa.

In summary, Boundary Scan is well established throughout the industry. The next step will be to extend its application by combining multiple test technologies and by improving Boundary Scan's ease-of-use, especially in design validation, repair on the manufacturing floor, and in field service.

Symmetricom has been controlling the time and frequency landscape for bus level processor modules for decades.

We can make this claim as a result of our recent merger with Datum and TrueTime, two companies known by the industry for providing precise, versatile, and dependable timing outputs for bus level integrated systems.

We offer PCI, VME/VXI, and PC bus level solutions. Each offers a wide array of time and frequency applications and can be configured within a wide variety of computing environments.

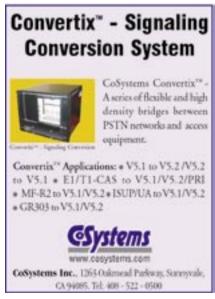

The integration efficiency of Symmetricom products is the key to your success. Whether you are making the move from the more expensive VME to the ruggedized CompactPCI, or have made the choice to go with the cost effective PCI, we offer the software and support to make integrating precise timing into your system as fast and as painless as possible.

What can you say about Convergence in a Box?

How about

Wouldn't it be nice if it were always this easy?

What if you could quickly and cost-effectively enable IP with your current SS7 network platform?

What if you could enable gateway technology for switching/routing IP over SS7 quickly and easily?

What if there were a single box that could save you hours of development time, get you to market faster... and save you thousands of dollars per link?

Well, there is. The Adax Signaling Gateways are here. So, now what are you going to do?

Here's a hint: www.adax.com

Introducing The Adax Signaling Gateways

Adax, the company you've come to trust to deliver signaling solutions across broadband, narrow band and IP networks, now offers you even greater choice. With the Adax Signaling Gateway, Tunneling Gateway, Signaling Extender and Signaling Router, you can now achieve network convergence in a single box.

Features:

- *A common hardware platform at the bottom and common management software at the top
- Consistent APIs--no proprietary software
- Gateways upgradable without having to change the application
- Complete flexibility and scalablity
- Low entry level via 1 to 4 SS7 link gateway, upgradable to 32 SS7 links
- Can be stacked for even higher density applications and redundancy.

The Parts.

The Sum of the Parts.

The Whole.

You decide.™

With more projects and less time than ever, you can't afford to rely on the same old products from the list of usual suspects. You need a vendor with a sterling record of satisfying clients such as Siemens, Nortel, IBM and Motorola.

Today we can offer you a full line of CompactPCI power supplies that won't plague you with the problems other manufacturers try to hide. For instance, Magnetek products comply with PICMG standards and feature 0 - 50° C operating range, no minimum load requirement, and single-wire current sharing. In addition, we offer a full line of CompactPCI products including:

- Two 200 W models in 3U size
 Six 350 W models in 6U size
- A new 300 W, 24 Vdc model
 Two 500 W models with IPMI interface in 2U rack-mount size

For proof positive that our CompactPCI power supplies are just what you're looking for, check out the full story at

www.magnetekpower.com/CompactPCI or call 800 621-0733 and we'll give you the whole story.

Think of it: affordable, qualified products delivered on time from a company you can trust. You just might discover a whole new source of satisfaction.

Magnetok Power Electronics Group, 8966 Mason Ave., Chotsworth, CA 91311, 800 621-0733 • www.magnetokpower.com/CompactPCI

WE UNDERSTAND TEST AND MEASUREMENT

BEHIND OUR NAME...

We at Geotest understand you. Since 1963, Geotest and The Marvin Group have been committed to creating innovative test solutions. We provide tomorrow's cutting edge technology that works for you today.

Our instrumentation, customization, and turn-key solutions reduce costs, improve quality, and increase performance. It's no wonder our products and systems are used worldwide in thousands of aerospace, semiconductor, communications, medical,

industrial, and military test applications. For more information on our off-the-shelf and custom hardware and software solutions, please visit us on the web, or call us at 888-TEST-BY-PXI.

Geek approved.

CFO endorsed.

This processor card pops the performance and drops the cost.

In the ongoing struggle between higher performance and lower cost, the clear winner is Motorola's PrPMC family.

Take, for example, the PrPMC815 with a security coprocessor option or the PrPMC800 with AltiVec technology. Both processor PMCs help you increase product performance and lower your total cost of ownership.

That's quite a combination.

So designers and bean counters no longer argue over which card to choose; instead they argue over who identified Motorola's processor PMCs first.

Motorola's family of high performance, flexible processor cards is designed to be the heart of DSP applications in medical equipment, semiconductor production and test equipment, and telecom equipment.

With a complete CPU and memory subsystem, the PrPMC family combined with Motorola's PowerPlus III architecture is the choice of the lab and the CFO to get high end, high performance products to market quickly.

Ethernet capabilities, power efficiency, and a small footprint all meet the demanding needs of the design team and the front office.

For full specs, applications, and availability of the PrPMC family, visit www.motorola.com/computer/arrow03 or call 1-888-427-2250.

Motorola's extensive family of processor PMCs pops your performance and drops your cost. Who says you can't please everyone? These are geek approved and CFO endorsed.

You Decide...Linux ready on every board

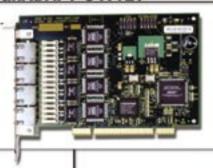

IanPMC-4Gx

Quad port Gigabit Ethernet copper or fiber PMC adapter

- 2 or 4 auto-negotiating 10/100/1000 Ethernet ports
- Fiber version supports long and short reach
- Auto sensing speed, simplex/duplex, flow control, and detection of polarity and cable lengths on copper version

wanADAPT-C4T1E1

Channelized quad port T1/E1/J1 PCI WAN adapter

- 128 channels (DS0)
- Line buildouts from DSX to DS1
- Supports D4, SF, ESF, SLC-96, JT-6704 framing
- Selectable clock options

HW400c/M DKL

6U CPCI processing blade with dual PTMC sites

- 333 MHz PowerPC CPU
- PICMG 2.16 Packet Switching Backplane enabled
- Dual 10/100 Ethernet ports
- Includes TimeSys Linux GPL Software Developer's Kit
- Drivers for T1/E1, T3/E3, HSSI, V.35, X.21 & other SBE PMCs

WAN . LAN . Storage . Carriers . Custom flexibility on demand 925-355-2000 info@sbel.com www.sbel.com

New CompactPCI Products

2U high and 4U high Carrier Class Enclosures

- Up to four 300 watt hot swappable power supplies
- Up to four front-loading hot swap fans in hot swappable canisters
- Hot swappable rear exhaust fans
- ■12" deep
- Front or center-mounted rack ears for 19" or 23" racks
- 4-slot or 8-slot cPCI backplanes in a variety of configurations including H.110 and 2.16

Portable Workstation

- Dimensions: 17" high x 12" wide x 20" deep
- 300 watt modular power supply with integral cooling fans
- Two 5.25" peripheral bays
- Two 3.5" hard disk removable canisters for hard disks
- 6-slot or 8-slot cPCI backplane with H.110 bus and transition module support
- Two hot-swappable fan trays
- Retractable handle on top

Call us today for a free Enclosure and Backplane Catalog and pricing.

 System and peripheral controllers with single or dual 700Mhz, 800Mhz, or 1.2Ghz PIII CPUs

RSC# 111 @www.compactpci-systems.com/rsc

One Stop Systems designs and manufactures a broad selection of standard, custom, and semi-custom CompactPCI backplanes, enclosures, and I/O boards for telecom/datacom industrial control, and military applications. Responsive service and the highest quality design and manufacturing, plus on-time delivery characterize our customer expectations.

CompactPCI Processor Boards

Whatever your application, we can offer you a choice of high performance CompactPCI® processor boards; these boards are PICMG* 2.16 compliant and support IPMI and many of today's leading operating systems including Windows*, Linux*, VxWorks*, QNX* and Solaris** Extended temperature products also available

Dual Xeon"

- dual 2.0GHz Xeon processors
- up to 4 Gbytes DDR DRAM
- high performance SCSI and EIDE
- 2 x Gigabit Ethernet interfaces
- PMC site or optional disk drives

Dual Pentium® III

- dual 933MHz Pentium III processors
- up to 1 Gbyte DRAM
- high performance SCSI and EIDE
- 4 x Gigabit Ethernet interfaces
- PMC site or optional disk drives

Pentium M (available Q4)

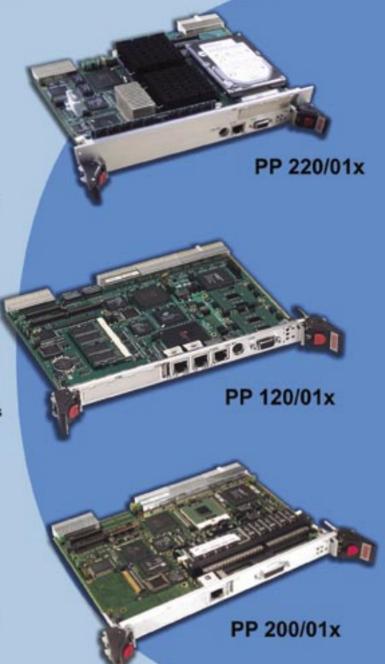

- 1.6GHz Pentium M
- up to 2 Gbytes DDR DRAM
- 3 x Gigabit Ethernet interfaces
- graphics, EIDE, + optional disk drives

Pentium 4

- 2.2GHz or 1.7GHz Pentium 4
- up to 2 Gbytes DDR DRAM
- 3 x Gigabit Ethernet interfaces
- high performance SCSI and EIDE
- PMC site or optional disk drives

Pentium III Dual PMC

- 1.2GHz or 800MHz Pentium III 512K
- up to 1.5 Gbytes DRAM
- 2 x Gigabit Ethernet interfaces
- graphics, EIDE and optional disk drives

NEW PRODUCTS

By Eli Shapiro

E-mail: newproducts@opensystems-publishing.com

BACKPLANE: SWITCHED FABRIC

Performance Technologies

Web site: www.pt.com Model: CPC440X

Model: CPC440X RSC No: 16668 A 10/100/1000 Ethernet switching platform • CompactPCI packet switching backplane-compliant • 24 10/100 auto-negotiating Ethernet ports • Two Gigabit ports • Rugged, hot-swap CompactPCI 6U form factor • PICMG 2.16-compliant • 802.3ad link aggregation, VRRP, 802.1q VLANs, and 802.1q CoS • Can be configured as a fully redundant, non-blocking switching fabric

BRIDGE: PCI-TO-PCI

PLX Technology

Web site: www.plxtech.com

Model: HB1 RSC No: 16388
A low-cost PCI-to-PCI bridge chip • PCI Local Bus specification rev 2.1 • CompactPCI Hot Swap compliant • Small footprint 128-pin package • Supports 3.3V, 32-bit, 33 MHz operation • Synchronous primary and secondary ports • Arbitration support for four bus masters on secondary interface

DATA ACQUISITION

National Instruments

Web site: www.ni.com

Model: PXI-4220 RSC No: 16771 A PXI data acquisition board for high-speed strain measurements • Two strain gauge inputs at 200 Ksamples/sec, 16-bit resolution • Programmable excitation (0V-10V) per channel • Programmable dain (1 to 1000) per channel • Programmable 4-pole Butterworth filter (10 Hz, 100 Hz, 1 KHz, 10 KHz) per channel • Quarter, half, and full-bridge completion • Differential simultaneous sampling inputs • Dual 9-pin D-Sub connectors (one per channel) • Two shunt calibration circuits per channel • Remote sensing • NI-DAQ driver simplifies configuration and measurements • Compatible operating systems: Windows 2000/NT/XP • Includes NI-DAQ 7 driver software

DATACOM: SERIAL CONTROLLER

VISTA Controls Corporation

Web site: www.vistacontrols.com

DSP RESOURCE BOARDS: COMPACTPCI

SMA Computers

Web site: www.SMAcomputers.com

Model: CDSP RSC No: 16502 A 3U CompactPCI DSP board • TI TMS320C6202 DSP at 300 MHz • 16 Mbytes of RAM • 1 Mbyte of Flash EPROM • Two 32-bit timers • Four 12-bit analog inputs • Two RS-422 serial ports • 24-bit line camera interface

ENCLOSURE + CARD RACK + POWER SUPPLY

Hybricon Corp.

Web site: www.hybricon.com

Model: RME21 Enclosures RSC No: 16208 A line of CoolSlot enclosures for CPCI PICMG 2.16, VME, and VME64x • 19 rackmount enclosures, 10U high, 21 Deep • CompactPCI PICMG 2.16, VME64x and VME backplanes available • Pac-2000 IEEE 1101.10/11 card cage • Front panel power switch (DC enable) • Reset switch • Handles • Optional peripheral mounting for three standard 5.25" peripherals

One Stop Systems Inc.

Web site: www.onestopsystems.com

Model: OSS-ENCL-6U-14-600 RSC No: 17003 8U high enclosure, gold chem filled aluminum (optionally painted to customer's specification) • 14-slot CompactPCl backplane with H.110 telephony bus (optional backplanes available) • Up to four 3U, hot-swap, 200W power supplies • Three hot-swap fans (53cfm each) and three hot-swap blowers (23cfm each) • Optional hard drive canisters • Optional Internet-based system monitor • TUV/UL agency approvals

GRAPHICS

VISTA Controls Corporation

Web site: www.vistacontrols.com

Model: Duros/PMC RSC No: 16047 Conduction cooled • High-resolution • Dual head display controller • Features Silicon Motion's 128-bit SM731 graphics accelerator • Dual VGA or VGA+DVI outputs • 2D/3D displays running on VxWorks or Linux • Supports DirectX and 3D/OpenGL when running Windows • 32-bit PCI bus, DMA controller • 235 MHz RAMDAC

I/O: DIGITAL

General Standards Corporation

Web site: www.generalstandards.com

Model: cPCI-HPDI32A **RSC No: 16617** A bi-directional, 32-bit digital I/O board that transmits and receives data at up to 80 Mbytes/sec (differential I/O) or up to 200 Mbytes/sec (Pseudo ECL I/O) • Useful as a general-purpose DMA interface to a variety of external peripherals • The DMA engine is capable of transferring data to/from host memory using D32 block transfers, while the FIFO memory (up to 1 Mbyte of total FIFO) provides continuous transmission of data without interrupting the DMA transfers or requiring intervention from the host CPU Seven bi-directional programmable handshake lines and eight pre-configured software selectable interface protocols . Available transceivers are RS-485/422 and PECL • Available in CompactPCI, PMC. PCI. and PC/104-Plus form factors

MIL-STD-1553

Western Avionics Ltd

Web site: www.western-av.com

Model: IIB-1553-PMC RSC No: 16880
An intelligent interface card providing full MIL-STD-1553 test, simulation and bus analysis capability for the PCI Mezzanine standard, with 1553A, 1553B, McAir, and STANAG 3838 variants
• Supports concurrent Bus Controller (BC) and up to 31 Remote Terminals (RT) with Bus Monitor (BM) • An additional stand-alone Chronological

Bus Monitor (CBM) facility is also provided, with comprehensive, multi-level triggering capability • Full error injection capability is provided in BC and RT modes, with full error detection in BC, RT, BM, and CBM modes • Provides a dual redundant 1553 interface • 2 Mbytes of dual-ported RAM • Supplied with C drivers in source code and Windows menu driven software

PROTOTYPING & DEBUGGING: BUS ANALYZER

FuturePlus Systems Corporation

Web site: www.futureplus.com

Model: FS2232 RSC No: 16384
An analysis tool for SCSI bus developers • Works in conjunction with Agilent Technology's family of logic analyzers • Allows monitoring of SCSI-based systems at 80 Mtransfers/sec • Displays SCSI bus activity, measures setup and hold violations, characterizes software, verifies compliance, and measures performance specifications

SERVERS

Pinnacle Data Systems, Inc.

Web site: www.pinnacle.com

Model: TS220 RSC No: 16998
A NEBS Level 3 and ETSI certified carrier grade rack server • 2U high • Utilizes up to two Xeon 2.80 GHz processors • Supports up to 12 Gbytes of DDR SDRAM main memory • Supports pluggable storage devices • Configurable for either AC or DC hot-swap power • Dry-contact external connector for managing system alarms

SOFTWARE: DEVELOPMENT TOOL

National Instruments

Web site: www.ni.com Model: TestStand

Model: TestStand
A ready-to-run test management environment for organizing, controlling, and executing automated prototype, validation, and manufacturing test systems • Graphical sequence editor environment • Adapters for tests written in any programming language • Multithreaded sequence execution engine • ASCII, HTML/Web, and XML report generation • Access, Oracle, and SQL Server database connectivity • Create, edit, execute, and debug sequences • More than 30 built-in step types to choose from • Develop custom test steps for unique requirements • Advanced sequencing, branching, and flow control • Source code control system integration

THERMAL MANAGEMENT

Universal Air Filter Co.

Web site: www.uaf.com **Model:** Broadband Dual EMI Filters

RSC No: 16507

Broadband equipment air filters • Meets the EMI/RFI noise shielding requirements of broadband communications equipment utilizing forced-air cooling techniques • Provides air filtration and EMI shielding in a single, compact assembly that is both removable and low cost • Integrates the honeycomb and/or stainless steel mesh EMI shield into the air filter assembly • Filter frames are configurable with EMI gaskets, finger stock, conductive caulk, and mounting holes for positive grounding • Compliant with UL 94 HF-1, UL 900 Class 2, CE, Telcordia NEBS GR-78-CORE, and GR-63-CORE • Optionally configurable to comply with the flame-drip requirements in III 60950

VIDEO: DISPLAY CONTROLLER

Peritek Corporation

Web site: www.peritek.com

Model: Duros/PMC **RSC No: 16514** A ruggedized, high-resolution COTS VGA graphics controller • Silicon Motion SM731 128-bit, 2D/3D graphics controller . Resolution up to 1600 x 1200 • Onboard 32-bit, 33/66 MHz PCI interface · Dual-head analog VGA output · DVI output (optional: single channel) . Pixel size is programmable for 8, 16, 24, and 32 bits/pixel • 16 Mbytes of SDRAM graphics memory . Hardware scroll, pan, and cursor • Field-programmable VGA BIOS EEPROM • Conduction cooled • Acrylic conformal coating . Parts screened for extended temperature Interlaced and non-interlaced STANAG 3350 A-C analog video standards . Composite and S-Video in PAL, NTSC, or SECAM . Non-interlaced RGB signals • Monochrome video in CCIR or RS-170 format • PCI and CompactPCI using Peritek's

PM-Series of carrier boards • Microsoft Windows 2000/XP support • X Windows support (Linux) • SDL Standard Drawing Library (VxWorks) • OpenGL support (Windows only)

VIDEO: PROCESSOR

Titan Corporation

Web site: www.titan.com Model: VigraWATCH **RSC No: 16511** An all-digital solution for real-time video/image acquisition, processing, and display . Integrates hardware accelerated processing with MPEG-2 compression • Provides MPEG-2 compression and/or decompression for the transmission of high-resolution digital video over lower bandwidths . Supports stereo audio input/output and MPEG-2 audio compression and/or decompression • Available as doublewide PMC mezzanine and 10.5" long PCI form factors • Supports the Solaris operating system • 2.5 Gbytes/sec video processing bandwidth . Utilizes a dense, highspeed FPGA combined with a IBM 440 PowerPC processor for real-time image processing and robust performance for MPEG-2 compression and decompression • MPEG-2 codecs support stereo audio as well as two vide channels . Supports two separate graphics displays, each with an independent video window in the display . Simultaneously displays real-time video with non-destructive graphics overlay to a window • Drives two SVGA monitors as scalable, de-interlaced video-only displays • 24-bit accelerated graphics up to 1600x1200 resolution on both displays • Onboard fully duplexed 10/100Base-T Ethernet • 16 Mbytes per channel of graphics memory and 24 Mbytes per channel of video memory . Interfaces to variety of standard and non-standard video cameras and other image sources

Model 767

CompactPCI Development System

- 6Ux160mm and 80mm T.M. Card Cages
- ☑ Choice of Backplane:
 - 8-slot PICMG 2.0, R2.1, RH System Slot
 - 7-slot PICMG 2.16, R1.0, RH System Slot
 - 7-slot PICMG H.110, RH System Slot
- ☑ IEEE 1101.10 Extrusions with EMI Shielding
- ☑ Push-Pull Cooling System
- 400W Power Supply
- Voltage Indicator LED Board with Test Jacks
- Optional Dual 2-slot 5-1/4 Drive Modules

Model 3100

Shown with 8-slot R2.1 Backplane

CompactPCI Development System

- Portable, Desktop or Rack Mount Configurations
- 5-slot, 6Ux160mm Card Cage with PICMG backplane
- ☑ IEEE 1101.10 Extrusions with EMI Shielding
- System Monitor Board Installed!
- 3-1/2 FRU Sliding Drive Pod
- \square 300W Power Supply
- Voltage Indicator LED Board

UMETRO

"At Hybricon, we understand your systems challenges and we have the products to prove it!"

As an industry leader, Hybricon prides itself on providing continuously progressive solutions to your individual requirements. Leading edge custom backplane designs that are designed **AND** simulated to be correct the first time, incorporated into **Thermally Innovative** packaging that provides a total working solution to your individual requirements **FAST!**

We manufacture a complete line of standard and custom enclosures, backplanes and backplane assemblies, portable towers, subracks, power supplies, custom front panels and more. Trust our knowledgeable staff to help you spec the proper solution. Call us at **1-877-HYBRICON** (492-7426) or visit **www.hubricon.com**

SRME CoolSlot** Enclosure

Hybricon's revolutionary new SRME horizontal rack-mount enclosure provides up to 6 slots of CompactPCI," VME, or VME64x in a space-saving 2U or 3U single-shelf format.

CoolSlot** Towers

Hybricon's CoolSlot[®] Towers are available in 6-slot, 9-slot, and 21-slot versions with CompactPCI, VME, or VME64x backplanes. Power options include embedded ATX, or 6U pluggable power supplies.

CompactPCI® Backplanes

Hybricon offers a full range of CompactPCI* backplanes, including the very latest technology. This includes PICMG 2.17 StarFabric and PICMG 2.16 Packet Switching backplanes, as well as PICMG R3.0 Hot Swap backplanes, available with or without H.110. Sizes range from 2 to 21 slots.

RME21 CoolSlot" Enclosure

Hybricon's new 10U RME21 rackmount enclosure supports 21 slot backplanes. A choice of CompactPCI* PICMG 2.16, VME, or VME64x backplanes is offered, Hybricon's PICMG 2.16 Ethernet Packet Switching backplanes are compliant with the PICMG 2.16 specification and provide 2 PICMG 2.16 fabric slots.

PRME CoolSlot®

Hybricon's new line of horizontal rackmount enclosures provide 2 slots of CompactPCI* or VME in a space-saving IU chassis with cooling for 55 watts per slot. The PRME series enclosures support rear plug-in and transition modules, plus one 2.5" slimformat hard drive. Power is provided by an embedded 150 watt ATX power supply.

PICMG 2.16 & 2.17 Development Kits

Hybricon's PICMG 2.16 Ethernet
Packet Switching Development
Kit and PICMG 2.17 StarFabric
CompactPCI Development Kit consist
of 9-slot towers with, respectively,
an 8-slot Ethernet Packet Switching
backplane or an 8-slot CompactPCI
StarFabric backplane. Both kits are
powered by an embedded ATX 300W
power supply.

Military COTS Enclosure

A full suite of COTS enclosures that can be easily customized to your requirements are available based on Hybricon's Pac-2000 packaging. Air-cooled or fluid-cooled, from submarines to HMMWV's to aircraft, Hybricon will deliver the weight, shock, EMI, and temperature specs your solution demands. We specialize in fast "time-to-market" solutions that work right the first time.

There's More...Check out our engineering and integration services on the reverse side....

Applied Technology and Engineering Services

"...And, our engineering and integration services are second to none. Think of us as your personal design team!"

In today's hyper-speed systems marketplace, time-to-market is everything. That's why you need a high-technology research and product development partner with the proven expertise and methodologies to design and integrate leading-edge packaging solutions with optimum speed, quality, and cost efficiency. You need Hybricon's Division of Applied Technology and Engineering Services.

Consider us an extension of your "A Team."

Acting as an extension of your design team, Hybricon's veteran packaging engineers can help shrink your time-to-market while delivering

custom packaging solutions specifically designed to your individual needs. Need a ground-breaking design that blows the competition away? Thermal and electrical simula-

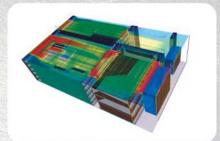

tions that leave no stone unturned? A Telecom NEBS cooling solution? The answer is Hybricon—a Sun Microsystems Strategic Developer.

Integration Services

- All of the packaging integration expertise, quality, and technical superiority you'd expect from a Sun Strategic Developer
- Total packaging solutions, including the sourcing of all materials required to bring your integration challenge from concept to realitu
- Prototype, low volume, and high volume manufacturing – Hybricon does it all
- Instrumental in developing both the new PICMG 2.16 CompactPCI® Packet Switching Backplane Specification and the PICMG 2.17 StarFabric CompactPCI® specification.
- A track record of successful COTS and ruggedized enclosures for military and aerospace applications, including air- and liquid-cooled enclosures.

Simulation Analysis and Modeling Services

- State-of-the-art simulation and 3D modeling analysis for electronics, electromagnetics, and cooling systems
- Ensures a "right the first time" launch by letting you predict signal performance before the prototype is ever built

- Eliminates the need for expensive cut-andtry prototypes or post-design modifications
- Ideal for what-if analysis and proof of concept before the enclosure and electronics are fabricated

Engineering Services

- World-class research and development lab for electronics packaging
- Complete turnkey design services for enclosures, backplanes, card cage/backplane assemblies, wire-wrap boards, extender cards, power supplies, and a host of custom products
- Combines the best of both worlds blazing-fast time-to-market with peerless ISO 9001-certified quality
- ThermoFlow modeling and simulation
- Temperature & airflow test equipment
- Advanced 2D and 3D Electromagnetic field modeling
- HSPICE signal integrity simulation
 - Transceivers, connectors, backplane geometry, design rules
- HSPICE simulation post processing
 - Eue patterns
 - TDR
 - TDT
- Backplane design
 - Electrical design
 - Low noise
- Enclosure design
 - Mechanical design layout
 - Structural design
 - Cooling design
 - Cable design
- NEBS design & consulting
- Platform/rack integration
 - Initial platform configuration
 - Sustaining engineering
 - System CPU cards
 - Peripherals, cables
 - Operating system and drivers

CompactPCI* backplanes are compliant to the latest PICMG' specification. CompactPCI* and PICMG' are registered trademarks of the PCI Industrial Computers Manufacturers Group. Highitron is a registered trademark of Highricon Corporation. CoolSlot is a trademark of Highricon Comporation.
